4. Qualys Whitelisting of IPs

Aim

To configure firewall/network whitelisting so that the required Qualys IP addresses and services can communicate with the protected system.

Procedure

1. Log in to the system where firewall/network restrictions are configured.
2. Identify the Qualys platform/Scanner/Cloud Agent IP addresses required for the environment.
3. Identify the required communication ports, commonly HTTPS/TCP 443 for Cloud Agent communication.
4. Open the firewall configuration.
5. Create an outbound rule allowing communication to the required Qualys IP addresses.
6. Configure the rule for the required protocol and port.
7. If required, configure corresponding inbound rules according to the Qualys deployment architecture.
8. Save/apply the firewall configuration.
9. Verify network connectivity to the required Qualys endpoint.
10. Confirm that the Qualys Cloud Agent can successfully communicate with the Qualys platform.
11. Check the agent status/check-in from the Qualys console.

Output

Firewall rule configuration

Result

The required Qualys IP addresses were successfully whitelisted, allowing the endpoint to communicate with the Qualys platform through the required network ports.

Note: Use the IP addresses and ports provided for your specific Qualys subscription/platform rather than copying IP addresses from another environment.
